

Campus-Based Principles and Proposed Governance Structures to Support Responsible Use of Artificial Intelligence

February 2025 Report
Chancellor's AI Council
University of California, Davis

1. Introduction

In May 2024, Chancellor Gary May established the campus Artificial Intelligence (AI) Council to implement recommendations from the University of California Presidential Working Group on Artificial Intelligence, which aim to shape the University's AI strategy. The working group's report, *Responsible Artificial Intelligence*, outlines core principles to guide the development and use of artificial intelligence across the UC system. In addition, the report includes numerous recommendations, including that each university location establish an Artificial Intelligence Council. Chancellor May charged the UC Davis AI Council to review "the systemwide report and work collaboratively to develop campus-based principles and a proposed governance structure to guide the appropriate use of Artificial Intelligence on our two campuses."

Council members convened over an eight-month period and conducted additional deliberations and research in four workgroups. Council members and the workgroups are listed in Appendix A. The Council also empaneled an ad hoc Interim Review Committee to identify and make determinations on time-sensitive AI-related issues affecting Administration and Services operations until more permanent structures are in place, and report to the AI Council on their activities.

The Council determined the UC Principles of Responsible AI to be a useful lodestar, identified a campus-based framing for governance structures (Section 2), and generated a set of recommendations for implementation (Section 3). Through their research and deliberations, the Council also observed that our campus is already emerging as a leader in responsible development and applications of AI (Section 4). Finally, the Council noted a number of features in the evolving regulatory and technological environment worthy of attention as reasons for both flexibility and agility in our governance and support structures moving forward (Section 5).

2. UC Definitions and Principles

The (systemwide) University of California AI Council defines an AI system as:

a machine-based system that is capable of influencing the environment by making recommendations, predictions, or decisions for a given set of objectives. It uses machine and/or human-based inputs/data to i) perceive environments; ii) abstract

these perceptions into models; and iii) interpret the models to formulate options for outcomes. AI systems are designed to operate with varying levels of autonomy.ⁱ

AI-enabled tools apply AI systems in a particular context (for instance, in the form of a chatbot). In 2021, the University of California adopted the following UC Principles of Responsible AI:ⁱⁱ

1. **Appropriateness:** The potential benefits and risks of AI and the needs and priorities of those affected should be carefully evaluated to determine whether AI should be applied or prohibited.
2. **Transparency:** Individuals should be informed when AI-enabled tools are being used. The methods should be explainable, to the extent possible, and individuals should be able to understand AI-based outcomes, ways to challenge them, and meaningful remedies to address any harms caused.
3. **Accuracy, Reliability, and Safety:** AI-enabled tools should be effective, accurate, and reliable for the intended use and verifiably safe and secure throughout their lifetime.
4. **Fairness and Non-Discrimination:** AI-enabled tools should be assessed for bias and discrimination. Procedures should be put in place to proactively identify, mitigate, and remedy these harms.
5. **Privacy and Security:** AI-enabled tools should be designed in ways that maximize privacy and security of persons and personal data.
6. **Human Values:** AI-enabled tools should be developed and used in ways that support the ideals of human values, such as human agency and dignity, and respect for civil and human rights. Adherence to civil rights laws and human rights principles must be examined in consideration of AI-adoption where rights could be violated.
7. **Shared Benefit and Prosperity:** AI-enabled tools should be inclusive and promote equitable benefits (e.g., social, economic, environmental) for all.
8. **Accountability:** The University of California should be held accountable for its development and use of AI systems in service provision in line with the above principles.

3. Recommendations for a UC Davis Model of AI Use and Development

The UC Davis AI Council's deliberations identified **three over-arching themes** requiring additional attention for full implementation of the eight Principles of Responsible AI Use: **(1)** provision of training and education, **(2)** governance and oversight structures, and **(3)** the need for coordinated action, led by the UC Office of the President, to achieve efficiency in resource allocation across all UC campuses as they integrate new hardware and generative AI (genAI) tools required for business operations, instruction, and research. The recommendations below emphasize these three themes, aiming to create structures that encourage AI use and development to generate innovation and growth opportunities consistent with the university's tripartite mission, while mitigating downside risks.

These recommendations come in parallel with a number of efforts at the systemwide and UC Davis levels. At the systemwide level, we expect and need helpful guidance and resources to emerge from systemwide AI Council activities and the Academic Senate's AI Workgroup. Within UC Davis, the Council expects synergy between the following recommendations and START taskforce efforts, in particular the Support Services process and technology (AI) efficiency workgroup and Research Computing workgroup. The Council's recommendations sometimes make explicit reference to existing *AI centers of learning* on campus. These include the AI Center in the College of Engineering, the Center for Artificial Intelligence and Experimental Futures in the College of Letters and Science, and the UC Davis Library and its DataLab. The recommendations are meant to be flexible to all of

these existing efforts and forthcoming developments across our and other UC campuses, as well as to evolution in the fiscal and regulatory environment.

1. **The Council recommends advocacy for leadership at the systemwide level to leverage economies of scale and scope from strategic pooled investment and coordination.** Currently, each campus is making individual investments where a pooled systemwide approach could save considerable resources, especially in the following areas:
 - a. Investments in centralized and centrally managed High-Performance Computing that minimize costs and recharge rates for UC users.
 - b. Pooled investment in development of a common local UC genAI app to ensure customized functionality and maximum privacy and data security for students, staff, and faculty using the app for business and scholarship.
 - c. Common training modules for employees in the use and vetting of genAI-powered tools.
 - d. Common education modules for students in risks and mitigation techniques when using different kinds of genAI apps.
 - e. A meeting of the co-chairs of all UC AI Councils may help identify areas where economies of scale or scope exist.
2. **Continuation of an AI Council for 3-5 years** with the following charge.
 - a. Survey and consult with administrative units, to develop supportive educational resources for the UC Davis community.
 - Work together with the Office of Information and Educational Technology (IET) and other campus partners with subject matter expertise, including the Student Disability Center and the Disability Issues Administrative Advisory Committee, to study the adherence to the eight UC Principles of Responsible AI in models underlying AI tools used on campus.
 - Raise awareness of potential problems that can arise from use of algorithms and modeling that are not transparent.
 - Monitor efforts to adapt and implement guidance from the UC Office of the President (UCOP) regarding risk assessment and mitigation for past and future acquisition and development of AI tools in the areas of Administration and Services, Instruction, Research, and Health.
 - b. Serve as a resource for UC Davis campuses by providing input on emerging AI-related policies upon request and reviewing existing UC Davis policies on data use or automated services to ensure AI is explicitly addressed where necessary.
 - c. Work with appropriate units to design a strategy to educate and encourage campus use of specific, responsible AI tools accessible **via UC Davis licenses wherever possible.**
 - UC Davis licenses for commercial products often contain added provisions to enhance data security and privacy (compared to commercial licenses offered for general sale), mitigating risk.
 - Until applications developed in-house from scratch match the capabilities of commercial products, UC Davis licenses with provisions to enhance data security are the best way to mitigate risk from use of genAI products for the UC Davis campuses.

- d. When new tools emerge, such as pilot projects developed at UC Davis, refer them to the AI Council's Instruction Committee for review or broader evaluation by other AI Council committees or university units before endorsing them for instructional or business use.
- e. Serve as a resource for addressing issues related to generative AI adoption or use by facilitating discussions and identifying subject matter experts for consultation before providing recommendations.
- f. Work together with IET and Center for Educational Effectiveness (CEE) to consider creation of a Sandbox for broad community experimentation in using and building AI tools.ⁱⁱⁱ
- g. Advise and collaborate with IET, the Office of Strategic Communications, and UC Davis AI learning centers to develop a central AI landing page for UC Davis campuses, serving as a primary web portal for both internal and external stakeholders.
- h. Committees of the AI Council described below may form satellite workgroups to invite input and deliberations from additional subject matter experts where a Committee Chair identifies a need.

3. Within the AI Council, to ensure that decisions about use or acquisition of specific AI tools receive adequate oversight, empanel a Services and Administration Committee with the same composition as the current AI Council ad hoc Interim Review Committee^{iv} (including a representative from UC Davis Health and the ODEI Impact Officer) plus an expert on the ethics and social studies of AI, to be co-chaired by the Vice Provost of Information and Educational Technology and Chief Compliance Officer, with the following charge.

- a. Identify and evaluate opportunities for applications of AI in business operations and service activities, with special attention to maintaining a bridge for communication of these updates and trends across the two UC Davis campuses.
- b. Design protocols and training for the systematic use and application of *UCOP AI risk assessment guidelines* across all units involved in vetting and procurement of AI-enabled tools.^v
 - Review, vet, and approve opportunities in Administration and Services that may be effectively addressed by the appropriate use of AI technologies; receive problems that may be solved or mitigated with a customized AI tool.
 - When requested by the Instruction Committee, work to adapt risk assessment guidelines and apply them to review proposals from instructors for the use or development of new tools.
 - When requested by the Research Committee, work to adapt risk assessment guidelines and apply them to review proposals from researchers for the use or development of new tools.
- c. Work with administrative units on both UC Davis campuses to design a program of education for administrative staff regarding the risks and responsibilities of using AI applications in campus operations.
- d. Co-chairs will regularly report to the AI Council.

4. Within the AI Council, empanel an Instruction Committee with the same initial composition as the current Instruction Workgroup with the following charge.

- a. Work with the Services and Administration Committee to determine how UCOP guidelines for AI tool risk assessment in services might be adapted to support instructors in vetting AI-enabled tools for instructional use. Evaluate whether the current Vendor Risk Assessment (VRA) process is suitable for tools developed and/or piloted by instructors for instructional use. Receive proposals to use new AI tools for instructional use and work with the Services and Administration Committee to vet and approve them using an appropriate modification of the UCOP guidelines for risk assessment and/or VRA.
 - b. Work together with the Office for Student Support and Judicial Affairs, Center for Educational Effectiveness, Office of Campus and Community Relations, and UC Davis Library to identify or design programs with the goal of ensuring that all students are educated on risks and benefits of AI use. Evaluate where trainings required for faculty could be updated to include information about risks of AI use, and where resources are lacking for faculty to who wish to integrate AI into instruction.
 - c. Work with the Office of Undergraduate Education (UE) and AI centers of learning on campus to create and maintain a list of existing and emerging courses and experiential learning activities for undergraduates similar to the list of Sustainability-related courses.^{vi} The list can be housed on a page within the UE website and also linked to from the central AI web portal mentioned in recommendation 1g.
 - d. Work with the Office of Instruction and Educational Technology to leverage existing assessments and ensure continual assessment about whether all students (including English learners) have adequate access to hardware and software needed to use AI tools standard in undergraduate education.
 - e. Work with AI centers of learning on campus¹ to survey and ensure that undergraduate and graduate students have extensive access to training in related coding and uses of AI tools. Monitor campus outreach and messaging to ensure awareness of available training.
 - f. Meet with the UC Davis team attending the American Association of Colleges & Universities Institute on AI Pedagogy.
 - Receive, discuss, and consider whether and how to implement recommendations from their report. Consider helping the team submit the report to the Academic Senate as a Request for Consultations.
 - g. Conduct regular discussions of updates and trends in AI-related pedagogical tools and curriculum to serve as a general clearinghouse for information on AI and instruction.
 - Identify resources to enable instructors who incorporate AI tools into their courses to assess the impacts on student learning outcomes and curate the lessons learned.
 - Identify resources to support instructors in evaluating the effectiveness, accuracy, and integrity of assessments when incorporating AI into at-home and in-class assignments and exams where AI use is permitted.
 - h. Chair or Co-chairs will regularly report to the AI Council.
5. **Within the AI Council, empanel a Research Activities and Compliance Committee** composed of the Vice Chancellor for Research or their designee, the Chief

¹ See Table 1 for non-inclusive list.

Information Officer and Vice Provost of Information and Educational Technology or their designee, a member of the Academic Senate Committees on Information Technology and Research, a representative from the Academic Federation Committee on Information Technology, a representative from the Academic Federation Committee on Research, the Dean of Graduate Studies or their designee, and the Chief Compliance Officer or their designee with the following charge.

- a. Work with the Services and Administration Committee to determine how UCOP guidelines for AI tool risk assessment in services might be adapted to support researchers and faculty vetting AI tools for use in sensitive research areas, such as research involving human subjects, or research with elevated risks related to data security and privacy.
- b. Determine whether faculty and other university employees involved in research that integrates or develops AI systems or AI-enabled tools have access to adequate educational resources to understand their risks and best practices for mitigation of risk.
- c. Work together with appropriate units across campus (including the Institutional Review Board) to identify or encourage the design of programs with the goal of ensuring all faculty and graduate student researchers are educated on risks and benefits of AI use.
- d. Work together with the Office of Instruction and Educational Technology and Office of Research to assess whether all faculty and graduate student researchers have adequate access to hardware and software to support the incorporation of AI-enabled tools in their research, as well as resources to stay abreast of opportunities for use.
 - Where possible, consider how to interface or elevate START recommendations that may help address deficiencies in hardware resources on the campuses.
 - Identify whether workshops or other resources exist to help researchers identify proper and improper uses of AI in their field, and develop a sense of best practices that their peers and colleagues are using.
- e. Work together with affiliated faculty, staff, and leadership in AI centers² of learning on campus to survey and ensure that faculty and graduate student researchers who wish to use AI have extensive access to training in related coding and uses of AI tools.
- f. Chair or Co-chairs will regularly report to the AI Council.

6. The Council recommends continued development and deployment of AggieAI.

- a. AggieAI is a set of tools and services designed for the UC Davis community by UC Davis, including a UC Davis-licensed and -maintained version of OpenAI for affiliate use that provides enhancements to data security.
- b. The lack of an effective and financially accessible UC-wide genAI tool necessitates continued local development. The committee feels this is an area of opportunity for efficiency gains through systemwide effort.
- c. Funding for effort and Token Costs is required to make AggieAI broadly available across campus. It is estimated that 1 Programming full-time equivalent (FTE) and \$25K Annually in Token Costs is needed to support Aggie AI infrastructure.

² See non-inclusive list in Table 1.

- d. The programming FTE will focus on maintaining and improving the Aggie AI infrastructure. This includes tasks such as integrating use cases, ensuring data security, and supporting pilots in teaching, research, and administrative domains.
 - e. The FTE will also be responsible for advanced programming tasks, such as implementing Retrieval-Augmented Generation (RAG) workflows to enhance the accuracy and relevance of AI responses by integrating external knowledge sources.
 - f. Assess computational costs incurred, such as the tokens required for queries and responses from OpenAI, to optimize use of resources. These costs vary depending on the size and complexity of the tasks performed.
7. **Student Affairs, IET, UC Davis Health, and relevant campus researchers should work together to understand the potential mental health implications of new generations of AI tools** like chatbots and determine appropriate strategies to ensure there is support for mental health among students, staff, and faculty interacting with AI tools. Several faculty on campus are researching this issue, including the impact of AI on teenagers.
8. **The Office of Finance, Administration and Operations (FOA) should review its plans for fiscal and environmentally sustainable sourcing of energy given expected load increases.** Other campus units should also regularly apprise FOA in advance of unique new demands driven by planned or projected adoption of AI tools, such as increased power needs from use of servers bearing greater loads from AI systems.
9. **The Chancellor may wish to engage the Chancellor’s Leadership Council to review the 5 pillars of the Strategic Plan to note the impacts and opportunities presented by AI.**

4. Emerging areas of leadership in AI at UC Davis

Areas where UC Davis is on the frontier of national and global policy and technology include (1) clinical practice, (2) an intellectually diverse community of scholarship related to AI embodied in AI learning centers, cutting-edge research, new and enhanced courses introducing AI-related topics and tools, and a Learning Community focused on AI in pedagogy, and (3) the pilot use of new AI tools developed in-house to streamline and expand the provision of campus services.

4.1 Clinical practice^{vii}

The University of California Health system, which includes UC Davis Health and other UC medical centers, was a nonprofit founding partner of the prominent Coalition for Health AI (CHAI), along with health systems like Mayo Clinic and Stanford Medicine and industry partners such as Amazon, Google, and Microsoft. Last year the coalition issued a “Blueprint for Trustworthy AI” to identify and propose solutions to issues that must be addressed for trustworthy health AI, such as risk of bias.

A variety of UC Davis Health researchers and clinicians are already using AI for disease patterns, looking for lifesaving insights in areas ranging from cancer screening and stroke diagnosis to opioid surveillance. Meanwhile, health system leaders and faculty are involved nationally in forging collaborative ways to advance AI adoption in an enlightened, equitable way.

4.2 Scholarship

4.2.1 Research

Researchers and scholars across UC Davis have been quick to realize the potential applications of AI to advance their goals for their research agenda. The uses of AI that are already underway, planned, or imagined by our faculty and researchers are far too numerous to catalogue in this report (see Table 1 for some examples), but some typical uses are worthwhile to illustrate the potential:

- Manipulation and analysis of extremely large or complex datasets (for example, imaging data from biology or astrophysics);
- Tasks for which conventional computational approaches have failed due to the complexity of the problem (the 2024 Nobel Prize for Chemistry, awarded for the use of AI to reliably predict protein structures, is an example of such a problem, as is earth systems atmospheric modeling to predict weather locally and accurately);
- Automation of experimental design and complex workflows to accelerate discovery by narrowing the experimental pathway to achieve the goals of the study (for example, in drug discovery and validation); and
- Preliminary review of the scholarly literature related to a particular topic or question, or meta-analysis of previous studies to arrive at a new synthesis of the existing data.

In addition, the potential benefits and risks of widespread adoption of AI are themselves topics of great interest for scholars, and researchers at UC Davis are actively working on developing the next generation of AI, its applications, and understanding how the current large language models actually function.

There are few, if any, disciplinary boundaries limiting the application of AI tools, and these applications extend well beyond research and scholarship to encompass every aspect of the creative arts. The table below includes a non-inclusive list of some of the research collaboratives emerging on campus.

4.2.2 Instruction

Faculty at UC Davis have recognized AI-generated text as presenting an opportunity to invite students to use disciplinary training to check its accuracy, content, and viewpoint as a classroom exercise. They also are using the user input into and output from AI tools as an opportunity for students to evaluate the process underlying the generation of the content—the range of data used to train a model and the weights apportioned to different types of data within a tool’s algorithms and modeling. It can also be used to create Problem-Based Learning scenarios.

Many instructors on campus are finding AI a particularly powerful tool to enhance pedagogy in writing instruction. Again, AI-generated text presents an opportunity to engage students in critiques of style, logic, persuasive voice, word choice, and other aspects of composition, improving their own in the process. One instructor reports breaking students into groups, having one group complete an assignment using only an AI tool, one an AI tool with human edits or revisions, and a third group writing themselves without any AI tool. The class compares and critiques the texts. (So far, the human-originated texts still win the most favorable ratings, though this may change as technology evolves.)

As another example of an iterative exercise involving instructors, students, and genAI tools, a consortium of faculty including from UC Davis recently received a \$1.5 million grant from the California Learning Lab AI Grand Challenge to study a program called Peer & AI Review + Reflection

Institution/Center	Research Focus
UC Davis AI Center in Engineering	Launched in October 2024, the mission of the center is to build transformative collaboration on AI across the campus and with industry partners, policymakers, and the community to leverage AI for the betterment of humanity and the planet. It offers courses like "Artificial Intelligence for All" and emphasizes entrepreneurial opportunities.
DataLab	Provides workshops and office hours to assist students, staff, and faculty who wish to learn beginning to advanced coding skills, including large language models. Collaborates with campus partners on AI-related research projects. Awarded \$1.8 million from the Sloan Foundation for continued development of virtual reality system for performing in situ analysis, visualization, and modeling of 3D datasets such as medical scans, geospatial data, and genetics.
UC Davis Center for AI and Experimental Futures	The center's scholarly activity will promote the democratic governance of AI systems by engaging diverse stakeholders in processes of creative worldmaking — crafting the world of tomorrow, together. It will experiment with new AI systems and community-design methods to prototype democratic modes of AI governance and responsible innovation. A collaboration with DataLab.
AI Institute for Food Systems	Focuses on AI-driven projects to improve food safety and systems for human health, such as FoodAtlas and AI in agriculture.
AI in Veterinary Medicine	Promotes AI in veterinary practices through networking, learning, and collaboration opportunities for professionals.
Center for Precision Medicine & Data Sciences	The UC Davis Center for Precision Medicine and Data Sciences uses data science, AI, and machine learning to improve healthcare. Their current projects focus on conditions like Traumatic Brain Injury, Metabolic Syndrome, and Delirium. One key project involves using natural language processing to analyze doctors' notes and extract useful information. The center collaborates with UC Davis Health and other partners to advance precision medicine.
Clinical & Translational Science Center	The UC Davis Clinical and Translational Science Center (CTSC) has launched a resource focused on the ethics of artificial intelligence, developed through the Research Data Ethics Maturity Model (README) project. This initiative seeks to integrate ethical frameworks into health data science research, emphasizing ethical practices in data collection, curation, and application.
Data Center of Excellence	Optimizes data usage at UC Davis Health to enhance clinical, research, and operational outcomes.
UC Davis Machine Learning and AI Group	Various affiliated labs focus on deep learning in computer vision, expert systems for medical informatics and biology, natural language processing and knowledge extraction, transfer learning and AI foundations, scalable machine learning and big data, and developing game AI and algorithms.
TETRAPODS Institute of Data Science	Current projects focus on understanding biological system morphology, genomic data analysis, and data clustering/classification. Some projects cover tasks like multiscale pattern mining, predictive decision-making, and error-free data modeling, high-dimensional statistical learning, feature selection, and data acquisition using wearable devices.
Davis Artificial Intelligence	A consolidation of select news articles from across campus that covers a range of AI applications, from agriculture to healthcare, climate change, energy, robotics, and social impact.

Table 1: Sample of AI-Related Research Initiatives at UC Davis

(PAIRR).³ In the PAIRR program, students engage in a sequential process of discussing short readings on AI, peer review of draft writing assignments, AI prompting to review the same drafts, critical reflection on and analysis of both reviews, and draft revision.

It is important to note that AI tools have not shown success in achieving persistent student engagement. Programming that does encourage persistence may engender risks described in section 4.1.6, so there is a fine balance and at this time, support from instructors, Teaching Assistants, Peer Learning Assistants, and Tutors is essential to encouraging student success.

GenAI tools can write code; some instructors have noticed that introducing AI tools makes coding more accessible for students who have difficulties getting started and open up new opportunities for data visualization and other analysis. This helps some instructors condense what used to be very time-consuming tasks for students to learn into easier formats for trial-and-error.^{viii} For example, ChatGPT and AutoML can help students clean large datasets by identifying and correcting errors, missing values, and inconsistencies. Instead of manually reviewing thousands of entries, students can automate this process, reducing hours of work to minutes. AI-powered tools like Leximancer or Voyant help students analyze qualitative data by generating thematic visualizations. For example, students can create word clouds or sentiment maps from survey responses without needing to learn standard tools like programming in R, enabling quicker understanding of patterns or trends.

Other instructors have noticed that AI can help promote student success by letting students create their own customized study tools aligned with their course materials. Google's NotebookLM can help students identify recurring themes in a text, generate study guides that are cross referenced with course materials, and serve as a Q&A assistant for any course readings.

At UC Davis, courses also have emerged and new ones continue to emerge to build and harness genAI tools more directly as an output with new applications (as opposed to studying them or applying them as a pedagogical tool).

In the future, faculty are envisioning AI tools that have the potential to be structured to provide more customized practice problem sessions for students struggling with math or other skills. In medicine and veterinary medicine, AI tools can be used to help train students to look for clinical patterns.

4.2.3 Campus administration and services

The campus is proceeding with care and caution in adopting AI-enabled tools to streamline and expand business operations and services through various pilot programs, but already has been forging new frontiers. A public-facing chatbot, “Gunrock,” is already in use by Enrollment Management to support in answering questions related to Admissions, Financial Aid, Registrar's Office, and Student Accounting.^{ix} “Rocky,” an AI tool to help students, staff, and faculty search the campus policies and other information, is also available in pilot form as a collaboration between IET and the College of Agriculture and Environmental Sciences.^x IET provides a speaker series^{xi} and website that serves as a focal point for AI-related opportunities and policy guidance on campus.^{xii}

³ <https://calearninglab.org/2024/11/20/ai-grand-award-announcements/> Thanks to Marit Macarthur, Lisa Sperber, and Carl Whithaus for sharing this excerpt from the project abstract.

5. Evolving AI policy and technological landscape

This report is written at a time when the State of California recently passed a slate of new legislation regulating the AI space. Students and researchers may encounter divergent approaches to use and regulation when working or collaborating in different states or countries.^{xiii} Systemwide policies are also evolving quickly to keep pace with regulatory and technological advances. In addition to the UC AI Council within UCOP,^{xiv} the Academic Senate also has convened a workgroup on AI to examine risks and opportunities for instruction, research, intellectual property, admissions, academic integrity, and other topics falling under faculty purview, and may consider issuing advice for faculty.^{xv} This rapidly evolving landscape highlights the need for governance and support structures for AI development and use on campus to be flexible in order to pivot as circumstances change, promoting responsible use and innovative scholarship.

Appendices

14

B. AI Council ad hoc Interim Review Committee for Business and Services

Charge: Given the need for timely decisions on adoption of tools and platforms incorporating AI, the AI Council established an ad hoc Interim Review Committee charged with reviewing, vetting and approving opportunities in Administration and Services that may be effectively addressed by the appropriate use of Artificial Intelligence (AI) technologies, until other decision-making structures and procedures recommended by the AI Council are reviewed and authorized.

Members: Associate Chief Information Officer, Information Technology Department, UC Davis Health; UC Davis Chief Information Officer & Vice Provost for Information and Educational Technology; UC Davis Privacy Officer; UC Davis Vice Chancellor for Facilities, Operations, and Accounting; UC Davis Vice Chancellor for Student Affairs; and a technical support designee for each of these five officers.
